EXPERIMENT – 15
CREATE A SNAPSHOT OF A VM AND TEST IT BY LOADING THE PREVIOUS VERSION

AIM

To create a snapshot of a virtual machine in VMware Workstation and then restore the virtual machine to the saved state.

REQUIREMENTS

1. A computer with VMware Workstation installed.
2. A configured virtual machine with a guest operating system already installed in it.
3. Enough free disk space on the host drive to store the snapshot files.

PROCEDURE

1. Open VMware Workstation and select the installed virtual machine from the library.
2. Power on the virtual machine and log in to the guest operating system.
3. Make a small test change in the guest, for example create a new folder or a text file on the desktop.
4. Select the virtual machine and click VM → Snapshot → Take Snapshot.
5. Enter a meaningful snapshot name and a short description, then click Take Snapshot to confirm.
6. Make one more change in the guest operating system, such as deleting the file or creating another folder, so that the snapshot can be tested.
7. Open VM → Snapshot → Snapshot Manager. The saved snapshots are shown in a tree and the current state is marked “You Are Here”.
8. Select the snapshot that has to be restored and check its name and description in the Snapshot details area.
9. Click Go To (or the equivalent restore option) and confirm the message that appears.
10. Start or inspect the virtual machine and check that the later change is gone and the VM has returned to the saved state.
11. Close the Snapshot Manager.

IMPLEMENTATION INPUT

A configured Ubuntu 64-bit virtual machine in VMware Workstation with snapshots available in Snapshot Manager.

OUTPUT

The screenshot shows the Snapshot Manager of the Ubuntu 64-bit virtual machine in VMware Workstation.

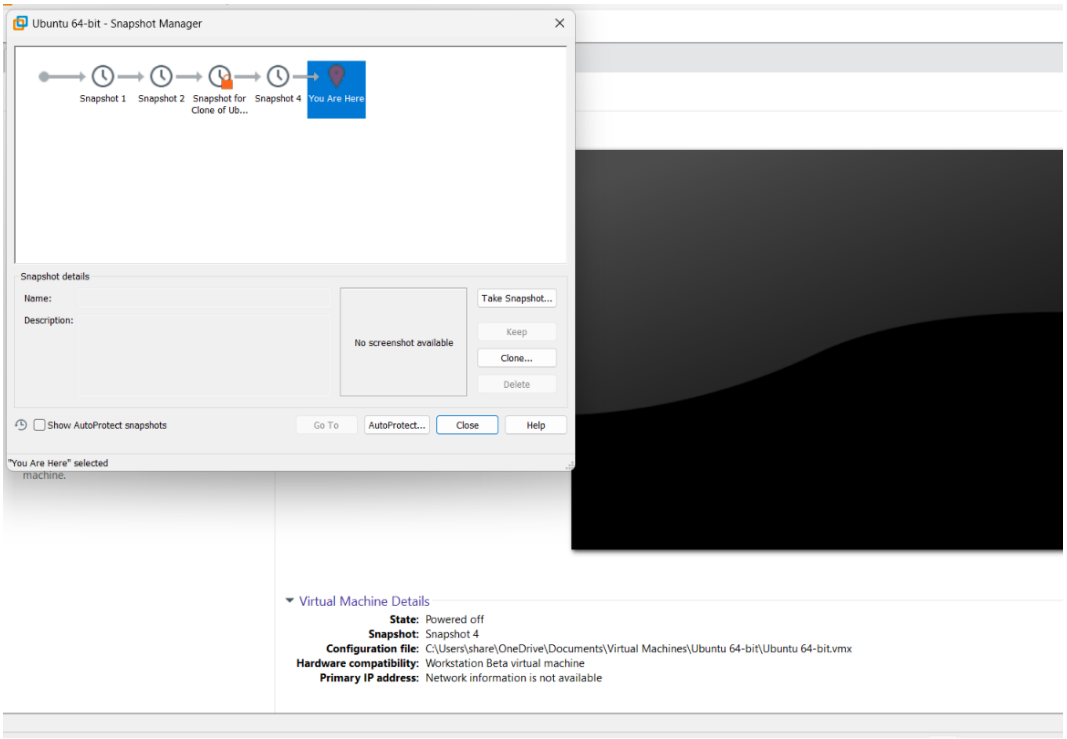

Figure 1: Snapshot Manager displays multiple snapshots and the current "You Are Here" state. The VM details indicate that the virtual machine is powered off and currently associated with Snapshot 4.

RESULT

The Snapshot Manager was opened successfully and the saved snapshot history is visible. The screenshot shows the snapshot-management stage only. To show a complete restore test, select an earlier snapshot, click Go To and take a screenshot of the confirmation or of the resulting VM state.
