CSA1507-Cloud computing and big data analytics
Experiment-8

Aim: Create a simple cloud web application for student counselling system using any Cloud Service Provider to demonstrate SaaS with the fields of student name, age, address, phone, subjects studied, Year of passing, percentage of marks, domain interest, etc.

Procedure:

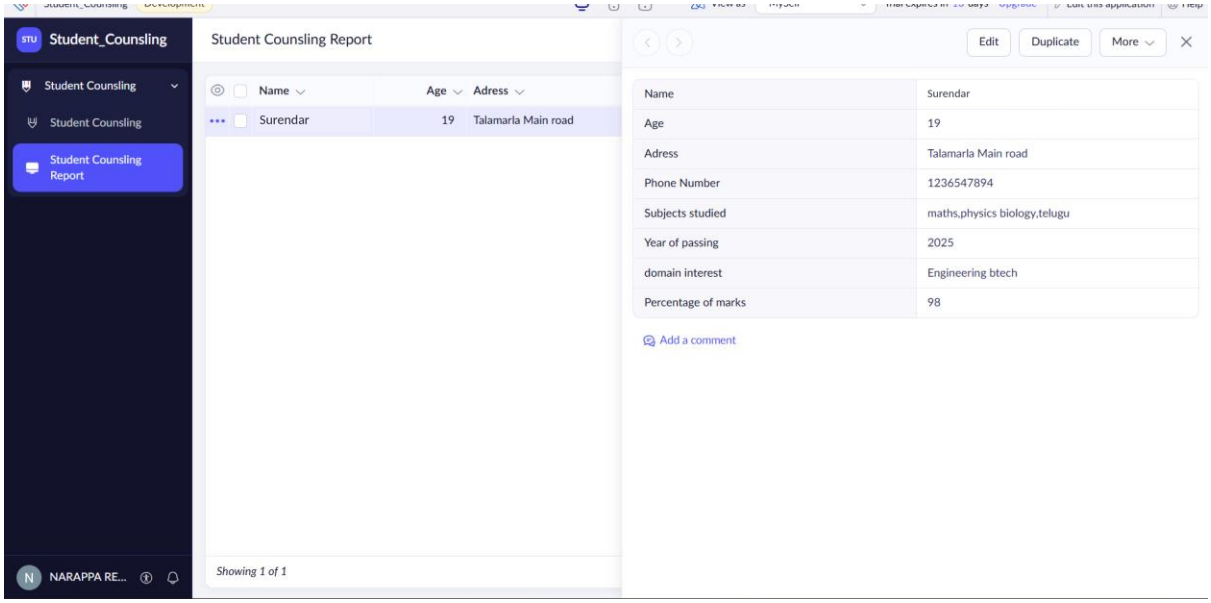

1. Sign in to a cloud service provider's low-code platform (Zoho Creator) and create a new application named "Student_Counsling".
2. Add a form named "Student Counsling" to the application; this form acts as the SaaS front end for entering counselling details online.
3. Add the Name field (First Name and Last Name) and the Age field as a number field.
4. Add the Address, Phone Number and Subjects Studied fields to capture contact and academic details.
5. Add the Year of Passing and Percentage of Marks fields as number fields.
6. Add the Domain Interest field to record the domain the student wants to pursue.
7. Keep a Submit button on the form so that each student record is saved to the cloud database.
8. Create the "Student Counsling Report" so that the stored records are listed online for the counsellor.
9. Open a record in the report to view the complete student details, and use Edit to update them when required.
10. Run the application, submit a sample student record, and verify that it appears in the report.

Input:

Output:

Name	Age	Adress	Phone Number	Subjects studied	Year of passing	domain interest
Surendar	19	Talamarla Main road	1236547894	maths,physics biology,telugu	2025	Engineering btech

Result:

The Student Counselling System was successfully developed as a simple cloud-based SaaS application. It stores student details such as name, age, address, phone number, subjects studied, year of passing, percentage, and domain interest. The system allows counsellors to access and manage student information online through the cloud.
